Thanks for purchasing our Electronic Speed Controller (ESC). High power system for RC model is very dangerous, please read this manual carefully. In that we have no control over the correct use, inappropriate application, or maintenance of our products, no liability shall be assumed nor accepted for any damages, losses or costs resulting from the use of the product. Any claims arising from the operating, failure or malfunctioning etc. will be denied. We assume no liability for personal injury, property damage or consequential damages resulting from our product or our workmanship. As far as legally permitted, the obligation to compensation is limited to the invoice amount of the affected product.

### Programmable Items

1. Brake Setting: Enabled / Disabled
2. Battery Type: LiPo / NIMH
3. Low Voltage Protection Mode (Cut-Off Mode): Soft Cut-Off (Gradually reduce the output power) (Cut-Off (Immediately stop the output power)
4. Low Voltage Protection Threshold (Cut-Off Threshold): Low / Medium / High
   - (1) For lithium battery, the battery cell number is calculated automatically. Low / medium / high cutoff voltage for each cell is: 2.8V/3.15V/3.3V. For example: For a 3S LiPo, when "Medium" cutoff threshold is set, the cut-off voltage will be: 3.15V/3.3V/3.3V/3.3V
   - (2) For NIMH battery, low / medium / high cutoff voltage is 0%/50%/65% of the startup voltage (i.e. the initial voltage of battery pack), and 0% means the low voltage cut-off function is disabled. For example: For a 6 cells NiMH battery, fully charged voltage is 1.4V/1.4V/1.4V/1.4V/1.4V/1.4V, when "Medium" cutoff threshold is set, the cut-off voltage will be: 8.4V/50%+4.10V.
5. Startup Mode: Normal / Soft / Super-Soft (300ms / 1.5s / 3s)
   - a) Normal mode is suitable for fixed-wing aircraft. Soft or Super-soft modes are suitable for helicopters. The initial acceleration of the Soft and Super-Soft modes is slower, it takes 1.5 seconds for Soft startup or 3 seconds for Super-Soft startup from initial throttle advance to full throttle. If the throttle is completely closed (throttle stick moved to bottom position) and opened again (throttle stick moved to top position) within 3 seconds after the first startup, the re-startup will be temporarily changed to normal mode to get rid of the chance of a crash caused by slow throttle response. This special design is suitable for aerobatic flight when quick throttle response is needed.
6. Timing: Low / Medium / High (3.75 / 15 / 26.25)
   - Usually, low timing is suitable for most motors. To get higher speed, High timing value can be chosen.

### Begin to Use Your New ESC

**Important:** Because different transmitter has different throttle range, please calibrate throttle range before flying.

#### Throttle Range Setting (Throttle range should be reset whenever a new transmitter is being used)

- **Connect battery pack to the ESC, and wait for about 2 seconds**
  - The "Beep-Beep-Beep" tone should be emitted, means the top point of throttle range has been confirmed
- **Move throttle stick to the bottom position, several "beep" tones should be emitted to present the amount of battery cells**
  - A long "Beep" tone should be emitted, means the lowest point of throttle range has been correctly confirmed

### Normal Startup Procedure

- **Move throttle stick to bottom position and turn on the transmitter**
  - Connect battery pack to ESC, special tone like "j 123" means power supply is OK
  - Several "beep" tones should be emitted to present the amount of lithium battery cells
  - When self-test is finished, a long "beep-Beep" tone should be emitted
  - Move throttle stick upwards to go flying

### Protection Function

1. **Start up failure protection:** If the motor fails to start within 2 seconds, the ESC will cut off the output power. In this case, the throttle stick MUST be moved to the bottom again to restart the motor. (Such a situation happens in the following cases: The connection between ESC and motor is not reliable, the propeller or the motor is blocked, the gearbox is damaged, etc.)
2. **Over-heat protection:** When the temperature of the ESC is over about 110 Celsius degrees, the ESC will reduce the output power.

### Troubleshooting

#### Problem

After power on, motor does not work, no sound is emitted

**Possible Reason**

- Input voltage is abnormal, too high or too low.

**Action**

- Check the power connection. Replace the connector.

### Program the ESC with your transmitter (4 Steps)

1. **Enter program mode**
2. **Select programmable items**
3. **Set item’s value (Programmable value)**
4. **Exit program mode**

Program the ESC with your transmitter (4 Steps): Note: Please make sure the throttle curve is set to 0 when the throttle stick is at bottom position and 100% for the top position.

#### 1. Enter program mode

1. Switch on transmitter, move throttle stick to top position, connect the battery pack to ESC
2. Wait for 2 seconds, the motor should emit special tone like "beep-beep-beep"

#### 2. Select programmable items

After entering program mode, you will hear 8 tones in a loop with the following sequence. If you move the throttle stick to bottom position within 3 seconds after one kind of tones, this item will be selected.

- beep
- beep-beep-beep
- beep-beep-beep-beep
- beep-beep-beep-beep-beep
- beep-beep-beep-beep-beep-beep
- beep-beep-beep-beep-beep-beep-beep
- beep-beep-beep-beep-beep-beep-beep-beep
- beep-beep-beep-beep-beep-beep-beep-beep-beep

**Note:** When you move the throttle stick to bottom position within 3 seconds after one kind of tones, this item will be selected. If you move the throttle stick to bottom position after 3 seconds, this item will be changed to the next item.

#### 3. Set item value (Programmable value)

You will hear several tones in loop. Set the value matching to a tone by moving throttle stick to top when you hear the tone, then a special tone "j 123" emits, means the value is set and saved. (Keeping the throttle stick at top, you will go back to Step 2 and you can select other items, or moving the stick to bottom within 2 seconds will exit program mode directly)

- **Items**
  - "beep-beep-beep-beep" (1 short tone)
  - "beep-beep-beep" (2 short tones)
  - "beep-beep-beep-beep" (3 short tones)

#### 4. Exit program mode

There are 2 ways to exit program mode:

1. In step 3, after special tone "j 123", please move throttle stick to the bottom position within 2 seconds.
2. In step 2, after tone "beep-beep-beep" (3 times) at item #8, move throttle stick to bottom position within 3 seconds.
